## CURRENT TO A MOVING CYLINDRICAL ELECTROSTATIC PROBE

W. R. Hoegy  
L. E. Wharton\*

### ABSTRACT

The current collection characteristics of a moving cylindrical Langmuir probe are evaluated for a range of probe speeds and potentials which are applicable to earth and planetary measurements. The current expressions derived include the cases of the general accelerated current, sheath area limited current, orbital motion limited current, and retarded current. For the orbital motion limited current, a simple algebraic expression is obtained which includes and generalizes the Mott-Smith and Langmuir expressions for both a stationary probe and a rapidly moving probe. For a rapidly moving probe a single formula adequately represents both the accelerated and the retarded current.

PRECEDING PAGE BLANK NOT FILLED

## INTRODUCTION

Cylindrical electrostatic probes have been widely employed on rockets and satellites for charged particle temperature and density measurements.<sup>1, 2</sup> In the future those devices may be used on planetary missions. A common feature of the planetary and earth electrostatic probes is the rapid vehicle velocity relative to the particle thermal velocity. The ratio of probe speed to thermal speed is denoted as the speed ratio. Typical speed ratios for 1000°K ions in the mass range 1 to 28 lie between 2 and 10.4 for a probe speed of 8km/sec (earth orbit) and between 12 and 65 for a probe speed of 50 km/sec (Jupiter entry probe). Speed ratios for 1000°K electrons vary from .046 to .29 for probe speeds between 8 km/sec and 50 km/sec.

Mott-Smith and Langmuir<sup>3</sup> derived two separate cylinder current expressions, one for a stationary probe and the other for a rapidly moving probe. Kanal<sup>4</sup> derived some integral formulas valid for arbitrary probe speed and from them, power series expressions which are valid only for small speed ratios. Bettenger<sup>5</sup> pointed out the need to develop a current expression which fills the void between the formulas for the stationary and the rapidly moving probes. In this paper we derive cylinder probe current expressions which are valid for a wide range of speed ratios and potentials. The current expressions are presented in a form which allow easy and rapid numerical evaluation.

## BASIC CURRENT EXPRESSIONS

We review briefly the derivation of the integral expression for the current to a moving cylindrical probe. All current formulas are normalized with respect to the random probe current and are denoted  $I$ ,

$$I = i / i_{\text{random}} \quad (1)$$

where  $i$  is the actual current, and the random probe current is given by:

$$i_{\text{random}} = A N q \sqrt{\frac{k T}{2 \pi m}}, \quad (2)$$

where  $A$  is the probe area,  $N$ ,  $q$ ,  $T$ , and  $m$  are respectively the particle density, charge, temperature, and mass.

The probe is assumed to behave as an idealized cylindrical Langmuir probe with a coaxial sheath of charged particles which is unperturbed by the relative probe-plasma drift motion. It is interesting to point out that the current expressions derived here are correct in the limit of high drift velocity — this is probably related to the fact that most of the particles collected by the probe came from the undisturbed portion of the sheath in the bow region. The probe is either guarded or is long enough so that end effects can be neglected. We also assume that no collisions take place within the sheath, and that outside the sheath the particles are not influenced by the presence of the probe. Particles which reach the collector surface are assumed to be collected. Under these conditions, the cylinder probe current is given by:

$$I = 2 \sqrt{\pi} \int_0^{2\pi} \frac{d\alpha}{2\pi} \frac{a}{r} \int d\vec{c} \vec{c} \cdot \hat{n} f(\vec{c}), \quad (3)$$

where  $a$  is the sheath radius,  $r$  the probe radius,  $\hat{n}$  a unit normal vector on the sheath edge,  $\alpha$  the azimuthal angle specifying the location of an area element of the cylindrical sheath, and  $f(\vec{c})$  is the Maxwell-Boltzmann distribution function in a frame fixed on the probe

$$f(\vec{c}) = \pi^{-3/2} e^{-(\vec{c} - \vec{s})^2}, \quad (4)$$

where  $\vec{c}$  and  $\vec{s}$  are respectively the particle and drift velocities normalized by the most probable particle velocity

$$\vec{c} = \vec{v} \sqrt{\frac{m}{2kT}}, \quad \vec{s} = \vec{w} \sqrt{\frac{m}{2kT}}. \quad (5)$$

The domain of integration in Eq. (3) is determined from the condition that the particles reach the probe surface using the conservation of energy and angular momentum. In terms of the velocity components  $c_z$ ,  $c_t$ ,  $c_n$ , respectively along the probe axis, tangent to the probe axis and the area element at  $\alpha$ , and normal to the area element at  $\alpha$ , the velocity limits are:

$$\begin{aligned} & -\infty < c_z < \infty \\ & \text{for retarded particles} \quad -\left(\frac{c_n^2 - V}{\frac{a^2}{r^2} - 1}\right)^{1/2} < c_t < \left(\frac{c_n^2 - V}{\frac{a^2}{r^2} - 1}\right)^{1/2} \\ & \sqrt{V} < c_n < \infty, \end{aligned} \quad (6a)$$

$$-\infty < c_z < \infty$$

$$\text{for accelerated particles} \quad -\sqrt{\frac{c_n^2 + V}{\frac{a^2}{r^2} - 1}} < c_t < \sqrt{\frac{c_n^2 + V}{\frac{a^2}{r^2} - 1}} \quad (6b)$$

$$0 < c_n < \infty,$$

where  $V = |e\phi/kT|$  is the normalized across the sheath potential. The four dimensional integral is reduced to a single integral using the change of variable  $c_n = \xi \cos \psi$ ,  $c_t = \xi \sin \psi$  and integration over  $\alpha$ ,  $c_z$ , and  $\psi$ :

$$I_{\text{ret}} = \frac{4}{\sqrt{\pi}} \int_{\sqrt{V}}^{\infty} \xi d\xi \sqrt{\xi^2 - V} e^{-(\xi^2 + s^2)} I_0(2\xi s) \quad (7)$$

for retarded particles and:

$$I_{\text{acc}} = \frac{4}{\sqrt{\pi}} \int_{\sqrt{\frac{V}{\frac{a^2}{r^2} - 1}}}^{\infty} \xi d\xi \sqrt{\xi^2 + V} e^{-(\xi^2 + s^2)} I_0(2\xi s) \\ + \frac{4}{\sqrt{\pi}} \frac{a}{r} \int_0^{\sqrt{\frac{V}{\frac{a^2}{r^2} - 1}}} \xi^2 d\xi e^{-(\xi^2 + s^2)} I_0(2\xi s), \quad (8)$$

for accelerated particles. In formulas 7 and 8  $s$  is the component of the speed ratio in the plane perpendicular to the probe axis.

Two approximations to the accelerating current are of general interest — the sheath area limited current and the orbital motion limited current. The current is approximated by the sheath area limited current when  $a/r$  is close to unity so that all particles entering the sheath are collected. The current is then independent of the across the sheath potential and depends only on  $s$  and  $a/r$ . To obtain this current the velocity domain (6b) is modified to allow all values of the tangential velocity,  $-\infty < c_t < \infty$ :

$$I_{sal} = \frac{4}{\sqrt{\pi}} \frac{a}{r} \int_0^{\infty} \xi^2 d\xi e^{-(\xi^2 + s^2)} I_0(2\xi s). \quad (9)$$

The general accelerated current approaches the orbital motion limited current when the sheath is much larger than the probe radius. In this limit,  $a/r \rightarrow \infty$ , the current depends only on  $V$  and  $s$ :

$$I_{oml} = \frac{4}{\sqrt{\pi}} \int_0^{\infty} \xi d\xi \sqrt{\xi^2 + V} e^{-(\xi^2 + V)} I_0(2\xi s). \quad (10)$$

The integral current expressions, Eqs. 7-10, are the starting point for the derivation of power series representations for the current which are discussed in the next section.

#### MOVING CYLINDER CURRENT EQUATIONS

The current collection characteristics for the moving cylinder probe are presented in various forms for a range of values of normalized potential  $V$

and speed ratio  $s$ . The derivations and details are found in the appendix starting with Eqs. A11 - A16.

### Sheath Area Limited Current

The sheath area limited current can be expressed as a single confluent hypergeometric function:

$$I_{sal} = \frac{a}{r} \phi \left( -\frac{1}{2}, 1; -s^2 \right), \quad (11a)$$

where  $\phi$  is defined by Eq. A8. An alternative form has been given by Heatley<sup>6</sup> and Kanal<sup>4</sup>

$$I_{sal} = \frac{a}{r} e^{-s^2/2} \left[ (1 + s^2) I_0 \left( \frac{s^2}{2} \right) + s^2 I_1 \left( \frac{s^2}{2} \right) \right] \quad (11b)$$

For small values of the speed ratio,  $s$ , the power series representation of  $\phi$  may be used to represent  $I_{sal}$  (Eq. A8). For large  $s$ , the asymptotic form of  $\phi$  (Eq. A17) gives the representation:

$$I_{sal} \approx \frac{a}{r} \frac{2}{\sqrt{\pi}} s \sum_{n=0}^M \frac{\left(-\frac{1}{2}\right)_n \left(-\frac{1}{2}\right)_n}{n!} \left(\frac{1}{s^2}\right)^n \quad (12)$$

$s$  large

$$= \frac{a}{r} \frac{2}{\sqrt{\pi}} s \left\{ 1 + \frac{1}{4s^2} + \frac{1}{32s^4} + \frac{3}{128s^6} + \dots \right\}.$$

### Retarded Current

The retarded current is initially given as a double series in  $V$  and  $s$ :

$$I_{\text{ret}} = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} \frac{(-s^2)^n (-V)^m \Gamma\left(n+m-\frac{1}{2}\right)}{n! m! \Gamma\left(m-\frac{1}{2}\right) \Gamma(n+1)} \quad (13)$$

Expressing the series in  $V$  as a confluent hypergeometric function and applying a Kummer transformation (Eq. A21), we obtain the retarded current in the form of an exponential in  $V$  (the retarded current for a stationary probe is  $e^{-V}$ ) multiplied by a power series in the speed ratio squared:

$$I_{\text{ret}} = e^{-V} \sum_{n=0}^{\infty} \binom{n-\frac{3}{2}}{n} \frac{(-s^2)^n}{n!} \phi\left(-n, -\frac{1}{2}; V\right), \quad (14a)$$

$$= e^{-V} \sum_{n=0}^{\infty} \frac{(-s^2)^n}{n!} L_n^{(-3/2)}(V) \quad (14b)$$

$$= e^{-V} \left\{ 1 + \left( \frac{1}{2} + V \right) s^2 + \left( \frac{V^2}{4} - \frac{V}{4} - \frac{1}{16} \right) s^4 + \dots \right\},$$

where  $L_n^{(\alpha)}(x)$  is the Laguerre polynomial. Equation 14 is applicable for small values of  $s$  and arbitrary values of  $V$ . This representation of the retarded current is particularly useful in describing the retarded electron current to satellites and planetary probes.

With the speed ratio,  $s$ , kept fixed and small, the retarded current decreases exponentially with increasing potential  $V$ ; however when the speed ratio is allowed

to increase, with  $V$  kept large and fixed, the current increases and loses its exponential character. The behavior is illustrated in the formula of Kanai which may be obtained from Eq. (14a) (see appendix Eqs. A22-A24):

$$I_{ret} = e^{-(V+s^2)} \sum_{n=0}^{\infty} \frac{\Gamma\left(n + \frac{3}{2}\right)}{n! \Gamma\left(\frac{3}{2}\right)} I_n(2s\sqrt{V}) \left(\frac{s}{\sqrt{V}}\right)^n. \quad (15)$$

As  $s$  approaches  $\sqrt{V}$  with  $V$  large, the modified Bessel function behaves asymptotically as

$$e^{2s\sqrt{V}} / \sqrt{4\pi s\sqrt{V}}$$

so that the exponential behavior is  $e^{-(\sqrt{V}-s)^2} \rightarrow 1$  as  $s \rightarrow \sqrt{V}$ .

Another representation for the retarded current (see Appendix Eq. A25-A29) is:

$$I_{ret} = \frac{e^{-(s-\sqrt{V})^2}}{\sqrt{4\pi s\sqrt{V}}} \sum_{n=0}^R \frac{\left(\frac{1}{4s\sqrt{V}}\right)^n}{n!} \left(\frac{1}{2}\right)_n \left(\frac{1}{2}\right)_n \left(1 - \frac{s}{\sqrt{V}}\right)^{-2n-3/2} \psi_n\left(\frac{s}{\sqrt{V}}\right) \quad (16)$$

$s\sqrt{V}$  large,       $s < \sqrt{V}$

where  $\psi_n(x)$  is a polynomial (Eqs. A28 & A29).

Note that because the potential is retarding, the current is small but not exponentially small as  $s \rightarrow \sqrt{V}$  from below. There is an abrupt change in behavior as the boundary  $s = \sqrt{V}$  is crossed; for  $s > \sqrt{V}$  the drift motion overwhelms the retarding potential and the current becomes large as  $s$  increases.

Again the exponential potential dependence is masked by the high drift velocity.

The expression for  $\sqrt{V} < s$  is obtained by summing Eq. 13 over  $s$ :

$$I_{ret} = \sum_{m=0}^{\infty} \frac{(-V)^m}{m!} \phi \left( m - \frac{1}{2}, 1; -s^2 \right). \quad (17)$$

The formulas for evaluating  $\phi$  are given in the appendix in Eqs. A30. An asymptotic form for  $s > \sqrt{V}$ ,  $s$  large, is (see Appendix Eqs. A31-A34):

$$I_{ret} \simeq \frac{2}{\sqrt{\pi}} s \sum_{n=0}^{\infty} \left( \frac{1}{s^2} \right)^n \frac{\left( -\frac{1}{2} \right)_n \left( -\frac{1}{2} \right)_n}{n!} \left( 1 - \frac{V}{s^2} \right)^{1/2 - 2n} P_n \left( \frac{V}{s^2} \right) \quad (18)$$

$s > \sqrt{V}, \quad s \text{ large}$

where  $P_n(x)$  is a polynomial of order  $n$  (Eqs. A33 and A34). The asymptotic behavior of the retarded current is:

$$\frac{2}{\sqrt{\pi}} \sqrt{s^2 - V}.$$

#### Orbital Motion Limited Current

The orbital motion limited current is given by the double series (Eq. A11, 12, 16):

$$I_{oml} = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} \frac{(-s^2)^n V^m}{n! m!} \left\{ \frac{\Gamma \left( n + m - \frac{1}{2} \right)}{\Gamma \left( m - \frac{1}{2} \right) \Gamma(n+1)} - \frac{V^{3/2} \Gamma(n+m+1)}{\Gamma \left( m + \frac{5}{2} \right) \Gamma(n+1)} \right\}. \quad (19)$$

The formula suitable for small speed ratios is obtained by summing over index  $m$ :

$$I_{om1} = \frac{2}{\sqrt{\pi}} \sum_{n=0}^{\infty} \binom{\frac{1}{2}}{n} (s^2)^n \psi \left( n - \frac{1}{2}, -\frac{1}{2}; V \right), \quad (20)$$

where  $\psi$  is given by Eqs. A7 and A35. The first term in the speed ratio expansion (Eq. 20) is the classical orbital motion limited formula of Mott-Smith and Langmuir.<sup>3</sup> For large values of  $V$ , the asymptotic series (Eqs. A36-A41) is appropriate:

$$I_{om1} \approx \frac{2}{\sqrt{\pi}} \sqrt{V + s^2} \sum_{m=0}^R \left( -\frac{1}{V} \right)^m \left( -\frac{1}{2} \right)_m \left( 1 + \frac{s^2}{V} \right)^{1/2-2m} Q_m \left( -\frac{s^2}{V} \right) \quad (21)$$

$s^2 < V$

where the polynomial  $Q_m$  is given by Eqs. A40 and A41.

For small values of the potential, another representation is obtained by summing Eq. 19 over index  $n$ :

$$I_{om1} = \sum_{m=0}^{\infty} \frac{V^m}{m!} \left\{ \phi \left( m - \frac{1}{2}, 1; -s^2 \right) - \frac{V^{3/2} \Gamma(m+1)}{\Gamma(m+\frac{5}{2})} \phi \left( m+1, 1; -s^2 \right) \right\} \quad (22)$$

The first term is identical to the retarded current expression with  $V$  replaced by  $-V$ . The evaluation of  $\phi(m - 1/2, 1; -s^2)$  is given by Eq. A30 and  $\phi(m + 1, 1; -s^2)$  by Eq. A42. For small values of the speed ratio,  $s$ , the retarded current and the orbital motion limited current are not identical under the transform  $V \rightarrow -V$ . However for high  $s$  values, the second term in Eq. 22 decays rapidly as  $e^{-s^2}$  and therefore

$$s \text{ large} \quad I_{\text{oml}}(V) \simeq I_{\text{ret}}(-V). \quad (23)$$

Consequently the asymptotic orbital motion limited current for  $s^2 > V$  is obtained from Eq. (18) with  $V \rightarrow -V$ :

$$I_{\text{oml}} \simeq \frac{2}{\sqrt{\pi}} \sqrt{s^2 + V} \sum_{n=0}^R \left(\frac{1}{s^2}\right)^n \frac{\left(-\frac{1}{2}\right)_n \left(-\frac{1}{2}\right)_n}{n!} \left(1 + \frac{V}{s^2}\right)^{-2n} P_n\left(-\frac{V}{s^2}\right). \quad (24)$$

$s^2 > V$

In the appendix it is demonstrated that Eqs. (21) and (24) are term by term identical (Eqs. A43-A45). Therefore these asymptotic expansions may both be written as:

$$I_{\text{oml}} = \frac{2}{\sqrt{\pi}} \sqrt{V + s^2} \sum_{k=0}^R \frac{A_k}{(V + s^2)^k} \sum_{\ell=0}^k B(k, \ell) \left(\frac{V}{V + s^2}\right)^\ell \cdot \left(\frac{s^2}{V + s^2}\right)^{k-\ell}, \quad (25)$$

where

$$A_k = \frac{\left(-\frac{1}{2}\right)_k \left(-\frac{1}{2}\right)_k}{k!}$$

$$B(k, \ell) = (-)^{\ell} \frac{(-k)_{\ell} (-k)_{\ell}}{\ell! \left(-\frac{1}{2}\right)_{\ell}}$$

Writing out the first few terms of Eq. 25 we have:

$$I_{om\ell} \simeq \frac{2}{\sqrt{\pi}} \sqrt{V + s^2} \left\{ 1 + \frac{\frac{1}{4}}{V + s^2} \left[ \frac{s^2}{V + s^2} + \frac{2V}{V + s^2} \right] + \frac{\frac{1}{32}}{(V + s^2)^2} \left[ \left( \frac{s^2}{V + s^2} \right)^2 + \frac{8Vs^2}{(V + s^2)^2} - \frac{8V^2}{(V + s^2)^2} \right] + \dots \right\} \quad (26)$$

To first order in  $\frac{1}{V + s^2}$  this form is identical with the expression:

$$I_{om\ell} \simeq \frac{2}{\sqrt{\pi}} \sqrt{V + s^2} + \frac{1}{2} \frac{s^2}{V + s^2} + \frac{V}{V + s^2} \quad (27)$$

$s^2$  large or  $V$  large

Formula (27) is the sought for generalization of the Mott-Smith and Langmuir approximations. For  $s = 0$  we obtain the stationary probe current equation

$$I_{om1} \Big|_{\substack{\text{Eq. 27} \\ s=0}} = \frac{2}{\sqrt{\pi}} \sqrt{1+V} \quad (28)$$

and for  $s^2 > V$  we obtain the formula:

$$I_{om1} \Big|_{\substack{\text{Eq. 27} \\ s^2 > V}} = \frac{2}{\sqrt{\pi}} \sqrt{V + s^2 + \frac{1}{2}} \quad (29)$$

which generalizes the Mott-Smith and Langmuir formula for high drift velocity by including the random thermal motion in the term  $1/2$  (the Mott-Smith and Langmuir formula is  $\frac{2}{\sqrt{\pi}} \sqrt{V + s^2}$ ).

#### General Accelerated Current

The power series representation for the accelerated cylinder current is obtained from Eqs. A11-A13 but will not be written explicitly. For small values of  $s$ , the integral representation is used directly to obtain the representation:

$$I_{ace} = \frac{2}{\sqrt{\pi}} e^{-s^2} \sum_{n=0}^{\infty} \frac{(s^2)^n}{(n!)^2} (f_n + g_n), \quad (30)$$

where  $f_n$  and  $g_n$  are given in the appendix (Eqs. A46-A51). No attempt is made to derive an asymptotic form from Eq. 30 for large  $V$  since the relation  $a'/r = a/r(V)$  is unknown. For large values of the speed ratio,  $s$ , the accelerated current reduces to the orbital motion limited current (see appendix Eqs. A52- and A53):

$$I_{acc} \approx I_{oml} \quad s \text{ large} \quad (31)$$

Consequently the current to a rapidly moving cylinder probe is given by a single formula Eq. 24 or Eq. 25 for both accelerated and retarded particles (with  $V$  replaced by  $-V$  for retarded particles).

## SUMMARY

The extensive use of the cylindrical electrostatic probe for in situ measurements of charged particles on rockets and earth satellites and its proposed use on planetary probes demonstrate the need to understand the effect of the relative probe to plasma drift velocity on the probe volt-ampere characteristics. To this end we have derived a number of series representations for the current to a moving cylinder probe starting from the four dimensional integral representations of the current. Four categories of current have been considered: general accelerated current, sheath area limited current, orbital motion limited current, and retarded current. Power series in both  $s$ , the speed ratio, and  $V$ , the normalized potential, have been given for all four cases. Simplified representations valid for small speed ratio  $s$  and arbitrary  $V$  as well as representations valid for large  $s$  have been presented. These representations fill the gap between the stationary and the rapidly moving probe theories of Mott-Smith and Langmuir.<sup>3</sup> One of the more useful of these is the formula for the orbital motion limited current:

$$I_{oml} = \frac{2}{\sqrt{\pi}} \sqrt{V + s^2 + \frac{V + \frac{1}{2}s^2}{V + s^2}} \quad (32)$$

which is valid for  $V + s^2 > 1$ . This formula, Eq. 32, can be used to evaluate the accelerated ion current for earth and planetary probes.

#### ACKNOWLEDGMENTS

The authors would like to thank L. H. Brace for bringing this problem to their attention, especially with regard to the requirements of planetary probes.

### Basic Power Series

We derive a power series representation for the cylinder probe current in powers of  $s^2$  and  $V$  from which asymptotic formulas valid for high  $s$  or  $V$  can be obtained. The summation yields series in confluent hypergeometric functions.<sup>7</sup>

The evaluation of the cylinder current as given by Eqs. 7-10 reduces to the problem of performing the integral:

$$I(q, r, s) = \frac{4}{\sqrt{\pi}} \int_{q/2}^{\infty} x dx \sqrt{x^2 + r} e^{-(x^2 + s^2)} I_0(2xs) \quad (A1)$$

The dependence of  $I(q, r, s)$  on  $s^2$  is simplified by performing a Laplace transform in  $s^2$ :

$$\tilde{I}(q, r, p) = \int_0^{\infty} ds^2 e^{-ps^2} I(q, r, s). \quad (A2)$$

Using the Laplace transform of the modified Bessel function<sup>8</sup>, we obtain the result:

$$\tilde{I}(q, r, p) = \frac{2}{\sqrt{\pi}} \frac{1}{1+p} \int_q^{\infty} dz (z+r)^{1/2} e^{-pz/1+p} \quad (A3)$$

This is in the form of an integral representation of the confluent hypergeometric function<sup>7</sup>,  $\psi(a, c; z)$ . Therefore using the relation,

$$\psi(a, c; z) = z^{1-c} \psi(a - c + 1, 2 - c; z), \quad (\text{A4})$$

we find:

$$\tilde{I}(q, r, p) = \frac{2}{\sqrt{\pi}} \frac{1}{1+p} e^{-pq/1+p} \left( \frac{1+p}{p} \right)^{3/2} \cdot \psi\left(-\frac{1}{2}, -\frac{1}{2}; \frac{p(q+r)}{1+p}\right) \quad (\text{A5})$$

To facilitate the separation of variables and taking the inverse Laplace transform, we partition I into two parts:

$$I(q, r, s) = I_1(r, s) + I_2(q, r, s) \quad (\text{A6})$$

$$\tilde{I}(q, r, p) = \tilde{I}_1(r, p) + \tilde{I}_2(q, r, p),$$

according to the relation between  $\psi$  and  $\phi$ :

$$\psi(a, c; z) = \frac{\Gamma(1-c)}{\Gamma(a-c+1)} \phi(a, c; z) + \frac{\Gamma(c-1)}{\Gamma(a)} z^{1-c} \phi(a-c+1, 2-c; z). \quad (\text{A7})$$

$$\phi(a, c; z) = \sum_{n=0}^{\infty} \frac{(a)_n z^n}{(c)_n n!} \quad (\text{A8})$$

The result of the partition is:

$$\tilde{I}_1(r, p) = \frac{1}{1+p} \left( \frac{1+p}{p} \right)^{3/2} e^{pr/1+p}, \quad (A9)$$

$$\tilde{I}_2(q, r, p) = - \frac{1}{1+p} \frac{(r+q)^{3/2}}{\Gamma\left(\frac{5}{2}\right)} e^{-pq/1+p} \varphi\left(1, \frac{5}{2}; \frac{p(r+q)}{1+p}\right) \quad (A10)$$

The inverse Laplace transform of  $\tilde{I}_1(r, p)$  is obtained by expanding it in a double series in powers of  $r$  and  $1/p$  and evaluating the residue at  $p = 0$ . The result is a power series in  $s^2$  and  $r$ :

$$I_1(r, s) = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} \frac{(-s^2)^n r^m \Gamma\left(n+m-\frac{1}{2}\right)}{n! m! \Gamma\left(m-\frac{1}{2}\right) \Gamma(n+1)} \quad (A11)$$

Similarly  $\tilde{I}_2(q, r, p)$  is expanded in a triple series in powers of  $(q+r)$ ,  $q$ , and  $1/p$ . Evaluation of the residue yields:

$$I_2(q, r, s) = - (r+q)^{3/2} \sum_{n,m,\ell}^{\infty} \frac{(-s^2)^n (-q)^m (r+q)^{\ell} \Gamma(n+m+\ell+1)}{n! m! \Gamma\left(\ell+\frac{5}{2}\right) \Gamma(m+\ell+1) \Gamma(n+1)} \quad (A12)$$

The four basic currents: accelerated, retarded, sheath area limited, and orbital motion limited are combinations of  $I_1$  and  $I_2$ :

$$I_{ace} = I_1(V, s) + I_2\left(\frac{V}{\frac{a^2}{r^2} - 1}, V, s\right) - \frac{a}{r} I_2\left(\frac{V}{\frac{a^2}{r^2} - 1}, 0, s\right), \quad (A13)$$

$$I_{ret} = I_1(-V, s), \quad (A14)$$

$$I_{sal} = \frac{a}{r} I_1(0, s), \quad (A15)$$

$$I_{oml} = I_1(V, s) + I_2(0, V, s) \quad (A16)$$

### Asymptotic Formulas

The asymptotic series for the confluent hypergeometric function  $\phi$  are derived from exact series representations

$$\phi(a, c; -z) = \sum_{n=0}^{\infty} \frac{(a-c+1)_n \Gamma(c) \gamma(a+n, z)}{n! \Gamma(c-a) \Gamma(a) z^{a+n}}, \quad (A17)$$

$a - c \neq \text{negative integer}$

$$\phi(a, c; z) = \sum_{n=0}^{\infty} \frac{(1-a)_n \Gamma(c) \gamma(c-a+n, z) e^z}{n! \Gamma(a) \Gamma(c-a) z^{c-a+n}}, \quad (A18)$$

$a \neq \text{negative integer}$

The incomplete gamma function,  $\gamma$ , may be written as

$$\gamma(a, x) = a^{-1} x^a \phi(a, a+1; -x). \quad (\text{A19})$$

For sufficiently large  $z$ , the following holds,

$$\Gamma(a) - \gamma(a, z) \sim z^{a-1} e^{-z}, \quad (\text{A20})$$

The Kummer transform for  $\phi$  is:

$$\phi(a, c; z) = e^z \phi(c-a, c; -z). \quad (\text{A21})$$

#### Kanal Formula for Retarded Current

To obtain the Kanal formula we begin with Eq. (14a), expand  $\phi$  and sum the series in  $s$ :

$$I_{\text{ret}} = e^{-V} \sum_{k=0}^{\infty} \frac{(V s^2)^k}{k! k!} \phi\left(k - \frac{1}{2}, k+1; -s^2\right). \quad (\text{A22})$$

Using the Kummer transform we obtain:

$$I_{\text{ret}} = e^{-(V+s^2)} \sum_{k=0}^{\infty} \frac{(V s^2)^k}{k! k!} \phi\left(\frac{3}{2}, k+1; s^2\right). \quad (\text{A23})$$

Finally we write out the series for  $\phi$  and sum over index  $k$ :

$$I_{\text{ret}} = e^{-(s^2+V)} \sum_{m=0}^{\infty} \frac{\left(\frac{3}{2}\right)_m}{m!} \left(\frac{s}{\sqrt{V}}\right)^m I_m(2s\sqrt{V}) \quad (\text{A24})$$

Using the Bessel function representation

$$I_m(x) = e^x \frac{\left(\frac{x}{2}\right)^m}{m!} \phi\left(m + \frac{1}{2}, 2m + 1; -2x\right), \quad (\text{A25})$$

We obtain the formula:

$$I_{\text{ret}} = e^{-(s-\sqrt{V})^2} \sum_{m=0}^{\infty} \frac{\left(\frac{3}{2}\right)_m (s^2)^m}{m! m!} \phi\left(m + \frac{1}{2}, 2m + 1; -4s\sqrt{V}\right) \quad (\text{A26})$$

Using the asymptotic expansion of  $\phi$  and summing over  $m$ , we obtain the result:

$$I_{\text{ret}} = \frac{1}{\sqrt{4\pi s\sqrt{V}}} e^{-(s-\sqrt{V})^2} \sum_{n=0}^R \frac{\left(\frac{1}{4s\sqrt{V}}\right)^n}{n!} \left(\frac{1}{2}\right)_n \left(\frac{1}{2}\right)_n \cdot {}_2F_1\left(\frac{3}{2}, \frac{1}{2} + n; \frac{1}{2} - n; \frac{s}{\sqrt{V}}\right). \quad (\text{A27})$$

The hypergeometric function may be transformed to the form:

$${}_2F_1 = \left(1 - \frac{s}{\sqrt{V}}\right)^{-2n-3/2} {}_2F_1\left(-n-1, -2n; \frac{1}{2} - n; \frac{s}{\sqrt{V}}\right), \quad (\text{A28})$$

where  ${}_2F_1 = \psi_n$  is a polynomial in  $s/\sqrt{V}$  of order minimum of  $n+1$ ,

2n. The first three values are:

$$\begin{aligned} \psi_0(x) &= 1 \\ \psi_1(x) &= 1 - 8x - 8x^2 \\ \psi_2(x) &= 1 - 8x + 48x^2 + 64x^3. \end{aligned} \quad (\text{A29})$$

### Evaluation of $\phi(m - 1/2, 1; -s^2)$

These functions are defined by the first two along with the recursion relation:

$$\phi\left(-\frac{1}{2}, 1; -s^2\right) = e^{-s^2/2} \left[ (1 + s^2) I_0\left(\frac{s^2}{2}\right) + s^2 I_1\left(\frac{s^2}{2}\right) \right]$$

$$\phi\left(\frac{1}{2}, 1; -s^2\right) = e^{-s^2/2} I_0\left(\frac{s^2}{2}\right) \quad (\text{A30})$$

$$\phi\left(m + \frac{3}{2}, 1; -s^2\right) = \frac{1}{m + \frac{1}{2}} \left[ (2m - s^2) \phi\left(m + \frac{1}{2}, 1; -s^2\right) + \left(\frac{1}{2} - m\right) \phi\left(m - \frac{1}{2}, 1; -s^2\right) \right]$$

### Asymptotic Form of Retarded current for $s^2 > V$

Substitution of the asymptotic form for  $\phi$  in Eq. 17 yields:

$$I_{\text{ret}} \approx \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} \frac{\left(\frac{-V}{s^2}\right)^m \left(\frac{1}{s^2}\right)^{n-1/2} \left(m - \frac{1}{2}\right)_n \left(m - \frac{1}{2}\right)_n}{n! m! \Gamma\left(\frac{3}{2} - m\right)} \quad (\text{A31})$$

The sum over index  $m$  yields the formula:

$$I_{\text{ret}} \approx \frac{2}{\sqrt{\pi}} s \sum_{n=0}^{\infty} \frac{\left(\frac{1}{s^2}\right)^n \left(-\frac{1}{2}\right)_n \left(-\frac{1}{2}\right)_n}{n!}$$

$$= {}_2F_1\left(n - \frac{1}{2}, n - \frac{1}{2}; -\frac{1}{2}; \frac{V}{s^2}\right) \quad (\text{A32})$$

A polynomial representation is obtained with the transform:

$${}_2F_1 \left( n - \frac{1}{2}, n - \frac{1}{2}; -\frac{1}{2}; x \right) = (1-x)^{1/2-2n} {}_2F_1 \left( -n, -n; -\frac{1}{2}; x \right), \quad (A33)$$

where  $P_n(x) = {}_2F_1(-n, -n; -1/2; x)$  is a polynomial of order  $n$ . The first few polynomials are:

$$P_0 = 1$$

$$P_1 = 1 - 2x \quad (A34)$$

$$P_2 = 1 - 8x + 8x^2.$$

#### Orbital Motion Limited Current for Small $s$

The confluent hypergeometric functions,  $\psi(n - 1/2, -1/2; V)$  are evaluated from the first two and the recursion relation:

$$\psi \left( -\frac{1}{2}, -\frac{1}{2}; v \right) = \frac{\sqrt{\pi}}{2} e^v \operatorname{erfc}(\sqrt{v}) + \sqrt{v}$$

$$\psi \left( \frac{1}{2}, -\frac{1}{2}; v \right) = \frac{\sqrt{\pi}}{2} (1 - 2v) e^v \operatorname{erfc}(\sqrt{v}) + \sqrt{v} \quad (A35)$$

$$\begin{aligned} \psi \left( n + \frac{3}{2}, -\frac{1}{2}; v \right) = & \frac{1}{\left( n + \frac{1}{2} \right) (n + 2)} \left[ \left( 2n + \frac{3}{2} + v \right) \psi \left( n + \frac{1}{2}, -\frac{1}{2}; v \right) \right. \\ & \left. - \psi \left( n - \frac{1}{2}, -\frac{1}{2}; v \right) \right]. \end{aligned}$$

An exact representation for  $\psi$  allows us to write the asymptotic form of  $\psi$  for large  $V$ :

$$\psi(a, c; z) = \sum_{n=0}^{\infty} \frac{(1+a-c)_n}{n! \Gamma(a)} \left[ \frac{\gamma(a+n, z)}{(-z)^n z^a} + z^{1-c} (-z)^n \Gamma(c-1-n, z) \right]. \quad (\text{A36})$$

Consequently we have the asymptotic form:

$$\psi\left(n - \frac{1}{2}, -\frac{1}{2}; V\right) \simeq V^{1/2-n} \sum_{m=0}^R \frac{(n+1)_m \left(n - \frac{1}{2}\right)_m (-)^m}{m! V^m}. \quad (\text{A37})$$

Substitution into Eq. (20) yields

$$I_{om1} \simeq \frac{2}{\sqrt{\pi}} \sqrt{V} \sum_{m=0}^R \frac{\left(-\frac{1}{V}\right)^m}{m!} \sum_{n=0}^{\infty} \left(\frac{s^2}{V}\right)^n \binom{\frac{1}{2}}{n} (n+1)_m \left(n - \frac{1}{2}\right)_m \quad (\text{A38})$$

When  $s^2 > V$  the series in  $n$  converges and may be written as:

$$I_{om1} \simeq \frac{2}{\sqrt{\pi}} \sqrt{V} \sum_{m=0}^R \left(-\frac{1}{V}\right)^m \left(-\frac{1}{2}\right)_m {}_2F_1\left(m+1, m - \frac{1}{2}; 1; -\frac{s^2}{V}\right), \quad (\text{A39})$$

where  ${}_2F_1$  has the representation

$${}_2F_1 = \left(1 + \frac{s^2}{V}\right)^{1/2-2m} {}_2F_1\left(-m, \frac{3}{2}-m; 1; -\frac{s^2}{V}\right), \quad (\text{A40})$$

where  $Q_m(x) = {}_2F_1(-m, 3/2 - m; 1; x)$  is a polynomial of order  $m$ . The first three terms are given as:

$$\begin{aligned} Q_0 &= 1 \\ Q_1 &= 1 - \frac{x}{2} \\ Q_2 &= 1 + x - \frac{x^2}{8} \end{aligned} \tag{A41}$$

Evaluation of  $\phi(m+1, 1; -s^2)$

Using Eq. A21 we find:

$$\begin{aligned} \phi(m+1, 1; -s^2) &= e^{-s^2} \phi(-m; 1; s^2) \\ &= e^{-s^2} L_m^{(0)}(s^2), \end{aligned} \tag{A42}$$

where  $L_m^{(0)}(x)$  is the Laguerre polynomial.

#### Term by Term Equivalence of $I_{om1}$ Expansions

The term by term equivalence of the two orbital motion limited series for  $V > s^2$  and  $s^2 > V$  follow from the proof of the equality:

$$\frac{\left(-\frac{1}{2}\right)_n}{n!} (s^2)^n P_n\left(-\frac{V}{s^2}\right) = (-)^n V^n Q_n\left(-\frac{s^2}{V}\right). \tag{A43}$$

The proof is accomplished by rearranging the polynomials.

$$\begin{aligned}
(-)^m V^m Q_m \left( -\frac{s^2}{V} \right) &= (-)^m V^m \sum_{k=0}^m \frac{(-m)_k \left( \frac{3}{2} - m \right)_k \left( -\frac{s^2}{V} \right)^k}{k! k!} \\
&= (s^2)^m \sum_{k=0}^m \frac{(-m)_k \left( \frac{3}{2} - m \right)_k \left( -\frac{V}{s^2} \right)^{m-k}}{k! k!} \quad (A44a)
\end{aligned}$$

Using the relation:

$$(\alpha - m)_k = \frac{(1 - \alpha)_m (-)^k}{(1 - \alpha)_{m-k}}, \quad (A45)$$

then

$$(-)^m V^m Q_m \left( -\frac{s^2}{V} \right) = (s^2)^m \sum_{k=0}^m \frac{(1)_m \left( -\frac{1}{2} \right)_m \left( -\frac{V}{s^2} \right)^{m-k}}{k! k! (1)_{m-k} \left( -\frac{1}{2} \right)_{m-k}} \quad (A44b)$$

Changing the dummy index  $m - k \rightarrow k$ , and using

$$\frac{m!}{(m-k)!} = (-)^k (-m)_k$$

we find

$$\begin{aligned}
&= (s^2)^m \frac{\left( -\frac{1}{2} \right)_m}{m!} \sum_{k=0}^m \frac{(-m)_k (-m)_k \left( -\frac{V}{s^2} \right)^k}{k! \left( -\frac{1}{2} \right)_k} \\
&= (s^2)^m \frac{\left( -\frac{1}{2} \right)_m}{m!} P_m \left( -\frac{V}{s^2} \right)
\end{aligned}$$

## Accelerated Current Functions

The functions  $f_n$  and  $g_n$  used in the speed ratio expansion for  $I_{acc}$  are given by:

$$f_0 = \sqrt{(1 + \gamma^2) V} e^{-\gamma^2 V} + \frac{\sqrt{\pi}}{2} e^V \operatorname{erfc} \sqrt{(1 + \gamma^2) V},$$

$$f_1 = \left( \frac{3}{2} + V \gamma^2 \right) \sqrt{(1 + \gamma^2) V} e^{-\gamma^2 V}$$

$$+ \left( \frac{3}{2} - V \right) \frac{\sqrt{\pi}}{2} e^V \operatorname{erfc} \sqrt{(1 + \gamma^2) V}, \quad (A47)$$

$$\gamma^2 = \frac{1}{\frac{a^2}{r^2} - 1} \quad (A48)$$

$$f_{n+2} = \left( n + \frac{5}{2} - V \right) f_{n+1} + V (n + 1) f_n$$

$$+ \gamma^2 ((1 + \gamma^2) V)^{3/2} e^{-\gamma^2 V} (\gamma^2 V)^n \quad (A49)$$

$$g_0 = \frac{a}{r} \left[ \frac{\sqrt{\pi}}{2} \operatorname{erf} (\gamma \sqrt{V}) - \gamma \sqrt{V} e^{-\gamma^2 V} \right] \quad (A50)$$

$$g_{n+1} = \left( n + \frac{3}{2} \right) g_n - \frac{a}{r} (\gamma^2 V)^{n+3/2} e^{-\gamma^2 V} \quad (A51)$$

Form of  $I_{acc}$  for Large  $s$

From Eqs. A13 and A16 we note that

$$I_{acc} = I_{oml} + \text{algebraic sum of three } I_2 \text{'s} \quad (A52)$$

The asymptotic behavior of  $I_2(q, r, s)$  for  $s$  large and fixed  $q$  and  $r$  is obtained by summing Eq. A12 over index  $n$ :

$$I_2(q, r, s) = -(r+q)^{3/2} \sum_{m, \ell}^{\infty} \frac{(-q)^m (r+q)^\ell}{m! \Gamma\left(\ell + \frac{5}{2}\right)} \phi(m + \ell + 1, 1; -s^2), \quad (A53)$$

and

$$\phi(m + \ell + 1, 1; -s^2) = e^{-s^2} \phi(-m - \ell, 1; +s^2)$$

which decays exponentially for large  $s$ .

The hypergeometric functions in Eqs. A27, A32, and A39 were expressed as polynomials using the theorem:

$$F(a, b; c; x) = (1-x)^{c-a-b} F(c-a, c-b; c; x).$$

An alternative method of evaluating these functions is directly through their recursion relations. The recursion relations may be obtained either from the contiguous function relations or by the use of successive raising and/or lowering operators. In the latter method, any two of the hypergeometric functions are expressed as products of raising and lowering operators acting on the third

function. Derivatives of order two or more are written as derivatives of order 1 and 0 using the differential equation. Finally the recursion relation is obtained by eliminating the first derivative in the two resulting equations.
